3. Action Plan

Phased Roadmap

4. Data Sources & Methodology

1. Executive Summary

This report presents a comprehensive SEO audit of **localhost-3001** for a **Developer tool / SaaS utility (client-only, no backend)** site, generated on July 29, 2026. Findings combine technical, content, schema, performance, visual, and search-readiness evidence as available.

87/100

SEO HEALTH SCORE

Critical Issues Found:

1. **Info:** Homepage now has an sr-only <h1> and its own schema — no longer thin content
2. **Info:** OG title/description on /json-diff and /large-files fixed — each now matches its own page
3. **Info:** Nav added linking all 3 pages — no more orphan pages
4. **Info:** Security headers (CSP, X-Frame-Options, HSTS, etc.) live site-wide
5. **Info:** OG image (1200x630) generated via Next's built-in ImageResponse

Quick Wins:

1. Verify NEXT_PUBLIC_SITE_URL is set in production
2. Run npm run build && npm run start and measure real Core Web Vitals
3. Add favicon size variants + manifest.json (still backlog)

2. Audit Categories

2.1 Technical SEO

Score: 92/100

What Works

- Valid robots.txt, dynamic sitemap.xml
- Security headers now live (CSP, X-Frame-Options, X-Content-Type-Options, Referrer-Policy, HSTS)
- Internal nav linking all 3 pages added
- Fast TTFB (~24ms, dev)

Findings

Canonical/sitemap URLs still resolve to localhost:3000 **Medium**

Code is correct (documented dev-only fallback when NEXT_PUBLIC_SITE_URL is unset) but cannot be verified as set in the real production deployment from this local session.

Recommendation: Confirm NEXT_PUBLIC_SITE_URL is set to the production domain in the deployment environment.

No favicon size variants or manifest.json **Low**

Only app/favicon.ico exists; no public/ directory.

Recommendation: Add 16/32/180/192/512 icon variants and a manifest.json if PWA installability is desired.

2.2 Content Quality

Score: 85/100

What Works

- /json-diff and /large-files have specific, accurate intro copy
- Homepage now has an H1 and schema-level description (previously had neither)
- No duplicate content across the 3 routes

Findings

Homepage has no visible body paragraph (H1 is sr-only) **Low**

Deliberate tradeoff — the homepage is a full-screen editor, not a landing page. Crawlers get real content via H1 + schema; sighted visitors get the existing empty-state hint text.

Recommendation: No action needed unless the product decision changes to a marketing-style homepage.

2.3 On-Page SEO

Score: **95/100**

What Works

- Distinct, well-length titles and meta descriptions per page
- OG/Twitter metadata now correct and page-specific on all 3 pages
- Title template centralized ("%s | JSON Viewer")
- Homepage has an H1 (sr-only)

2.4 Schema / Structured Data

Score: **90/100**

What Works

- Each page now has its own SoftwareApplication JSON-LD, no longer a single shared block

Findings

No BreadcrumbList / FAQPage **Low**

Minor, not blocking — no FAQ content exists to mark up.

Recommendation: Add if FAQ content or a breadcrumb-style nav is introduced later.

2.5 Performance (CWV)

Score: **75/100**

What Works

- Web Worker parsing, virtualized rendering, self-hosted fonts — unchanged, still solid

- New CSP header verified not to break the Web Worker or JS-eval fallback

Findings

No production build measured **Medium**

Still open from the last audit — all timings are dev-server only.

Recommendation: Run `npm run build` && `npm run start` and measure with Lighthouse.

2.6 AI Search Readiness

Score: 75/100

What Works

- Subpage copy still specific and quotable
- robots.txt allows AI crawlers
- Homepage now has schema + H1 for AI engines to draw from

2.7 Images

Score: 80/100

What Works

- OG image now generated and served at `/opengraph-image`

Findings

No favicon size variants **Low**

Only `app/favicon.ico` exists.

Recommendation: Add standard icon sizes for iOS/Android/Windows.

3. Action Plan

Phase 1: Critical Fixes Week 1

- Verify NEXT_PUBLIC_SITE_URL is set correctly in production (only remaining item that couldn't be fixed in code)

Phase 2: High-Impact Improvements Weeks 2-3

- Run a production build and re-measure Core Web Vitals with Lighthouse

Phase 3: Content & Authority Month 2

- Add favicon size variants + manifest.json

Phase 4: Monitoring & Iteration Ongoing

- Re-run this audit after each phase to confirm score improvement
- Watch Search Console (once live) for indexation status on all 3 URLs

Data Sources & Methodology

Source	Description	Update Frequency
PageSpeed Insights API	Lighthouse lab audit (mobile emulation, Moto G Power, slow 4G)	Real-time
Chrome UX Report (CrUX)	28-day rolling field data from real Chrome users	Daily ~04:00 UTC
CrUX History API	25-week p75 trend data per metric	Weekly
Google Search Console	Search Analytics (clicks, impressions, CTR, position)	2-3 day lag
URL Inspection API	Per-URL index status, coverage state, crawl info	Real-time (2,000/day)
